Align Borealis
by S

1993

This text needs re-working:

Borealis is a two video/four audio channel installation. It is designed to present its images on four vertically positioned, translucent screens. For this, two video projectors are placed on their side with a half mirror in the front of the lens, splitting each projector beam into two images, thus filling all four screens. The translucent screens show the projected image with equal intensity on both the front and rear surface, resulting in..... The moving images are stored on a pair of LaserDisk players which recycle and re-synchronize the 10 minutes program continuously. The Vasulka disk Synchronizer works with Pioneer industrial Laser disk players (LD-V2200 to 8000 series) and is not interchangeable with other manufacturers of Laser Disks Players.

a three-channel, 12 or more monitors

Change:

should this be "quote/unquote"?

Last year I spent a few hours with blacksmith Tom Joyce taping the down. _

Steina _

Pyroglyphs is a three video/six audio channel installation on a 20 minute repeated loop. Each of the two video players (tape or disk) provides one video and two audio sources to a bank of video monitors and six speakers. A video synchronizer aligns the two channels of video for synchronous playback. At the end of each cycle the program automatically returns and re-synchronizes for a repeat performance. The Vasulka disk Synchronizer works with Pioneer industrial disk players (2200 to 8000 series).
